Assignment 3

1. List 5 different types of cyber security threats you might encounter while using popular apps like Instagram, WhatsApp, or Zomato, and give a real-life example for each.

Ans-

Threat	Real-life example	Prevention
1. Phishing	A user receives a fake Instagram message saying their account will be suspended and asking them to log in through a link.	Check the URL and never log in through suspicious links.
2. OTP scam	A fraudster pretends to be customer support and asks for a WhatsApp verification code.	Never share OTPs or verification codes.
3. Malware	A user installs a fake food-delivery APK that contains malicious software.	Install apps only from trusted sources.
4. Account takeover	An attacker uses a leaked or reused password to access someone's Instagram account.	Use a unique password and enable two-factor authentication.
5. Data breach	A service suffers a security incident that exposes customers' personal information.	Use unique passwords, monitor account alerts, and limit personal information shared online.

**2. Simulate a phishing attack scenario by designing a fake login page for an app you use (for example, a mock Instagram or Flipkart login screen in HTML). Explain how a user could be tricked and what signs would help spot the threat.

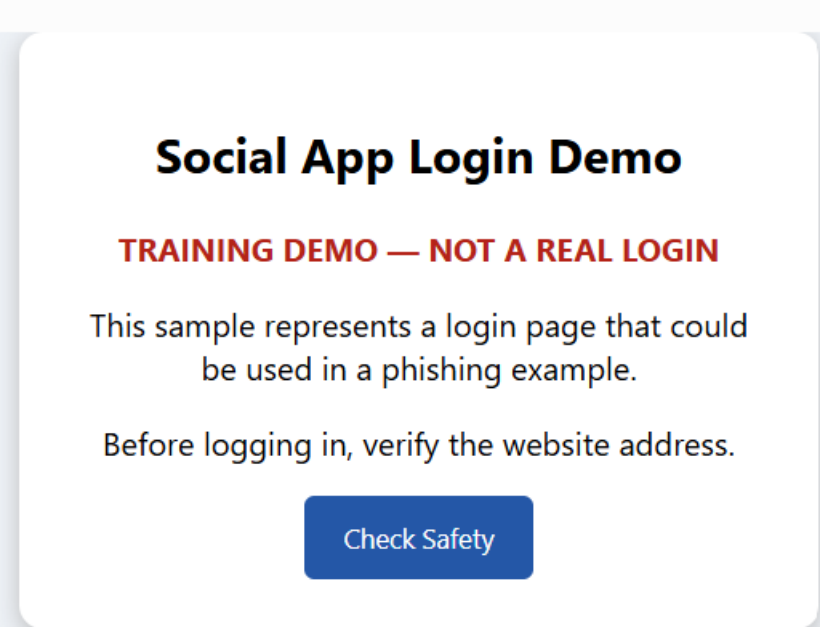

Hint: Do not collect or submit any real credentials—just create the page design and description.**

Ans-

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <title>Phishing Awareness Demo</title>
  <style>
    body {
      font-family: Arial, sans-serif;
```

```
      background: #eef2f7;
      text-align: center;
      padding: 40px 15px;
    }
    .card {
      background: white;
      max-width: 350px;
      margin: auto;
      padding: 25px;
      border-radius: 12px;
      box-shadow: 0 3px 12px #bbb;
    }
    .warning {
      color: #b42318;
      font-weight: bold;
    }
    button {
      padding: 12px 20px;
      background: #2457a7;
      color: white;
      border: 0;
      border-radius: 5px;
    }
  </style>
</head>
<body>
  <div class="card">
    <h2>Social App Login Demo</h2>
    <p class="warning">TRAINING DEMO — NOT A REAL LOGIN</p>
    <p>This sample represents a login page
```

```
      that could be used in a phishing example.</p>
    <p>Before logging in, verify the website address.</p>
    <button onclick="alert('Warning: Always verify the website URL!')">
      Check Safety
    </button>
  </div>
</body>
</html>
```

3. Research and write a short report (150-200 words) on a recent cyber attack that affected a major Indian tech platform (such as Paytm, IRCTC, or PhonePe). Describe the type of threat, how it was carried out, and what was done to fix it.

Ans-

Cybersecurity Report: Malicious Bot Activity Targeting IRCTC

Platform: Indian Railway Catering and Tourism Corporation (IRCTC)

Type of threat: Automated bot abuse and suspicious account activity.

IRCTC's online ticket reservation system faces abuse from automated tools that can submit booking requests rapidly and interfere with fair ticket availability. Such tools may be used by individuals or ticketing operators to automate bookings, bypass normal user workflows, or gain an unfair advantage during busy Tatkal booking periods.

On February 13, 2026, India's Ministry of Railways reported that the railway ticketing system had blocked approximately 60.43 billion malicious bot requests during the six months ending December 2025. The government also reported that 3.03 crore suspicious user IDs were

deactivated during 2025. These figures describe reported defensive activity; they do not establish that a data breach occurred.

The response included Aadhaar-based OTP authentication for Tatkal bookings, security monitoring, regular security audits, and verification of suspicious accounts. These measures help distinguish genuine users from automated or fraudulent activity and protect the fairness and availability of ticket booking services.

Conclusion: The IRCTC example demonstrates why strong authentication, bot detection, monitoring, and regular security audits are important for large online platforms.

4.Pick any one cyber security threat (like ransomware, phishing, or DDoS) and create a simple infographic or poster (hand-drawn or digital) that explains how it works, who is at risk, and how to prevent it.

Ans-

Step 1: Open PowerPoint

1. Open Microsoft PowerPoint.
2. Select Blank Presentation.
3. Choose a blank slide layout.
4. Add a title at the top: STOP PHISHING — THINK BEFORE YOU CLICK!

Step 2: Add the poster content

STOP PHISHING!

Think before you click.

How does it work?

1. An attacker sends a fake message.
2. The victim clicks a suspicious link.
3. A fake page tries to steal login details.

Who is at risk?

- Social media users
- Online shoppers
- Banking and payment app users

How to prevent it

- Verify the full website URL.
- Never share OTPs or passwords.

- Enable two-factor authentication.
- Report suspicious messages.

PAUSE • CHECK • PROTECT

Step 3: Make it look like a poster

- Use red or orange for warnings.
- Use green for prevention tips.
- Insert icons from Insert → Icons in PowerPoint.
- Keep the title large and the text easy to read.

Step 4: Save and take a screenshot

1. Click File → Save As.
2. Save as Phishing_Awareness_Poster.pptx.
3. Take a screenshot of the completed slide for your assignment.
