1.Use Google search operators to find publicly accessible PDF files about IPL cricket rules. List the exact search query you used and share 3 working links you found.

Ans-

**2.Search for login pages of Zomato by using Google dorking techniques. Write the search query you used and explain why it works.

Hint: Try using 'inurl:login site:zomato.com'.**

Ans-Step 1: Open Google: Visit Google Search.

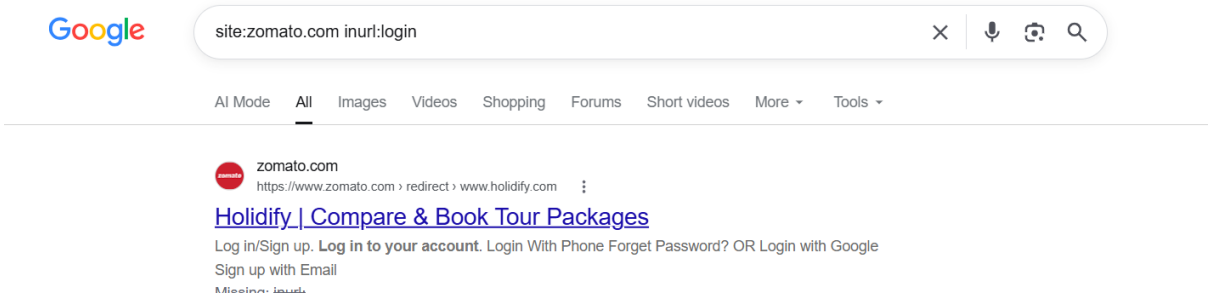

Step 2: Enter the query: site:zomato.com inurl:login

Step 3: Understand why it works

- site:zomato.com limits results to pages Google associates with that domain.
- inurl:login asks Google to find indexed URLs containing the word login.

The search may return login-related pages, ordinary pages, or no useful results. Google indexing does not guarantee that a page is current or accessible.

Step 4: Record your observation

3.Find exposed Excel files containing the word 'playlist' from Spotify-related domains using Google hacking methods. Share your search query and one result (URL) you found.

Ans-

Step 1: Enter a Google query

Spotify playlist filetype:xlsx

Copy querySearch Google

Step 2: Understand the operators

- Spotify playlist — searches for spreadsheet-related content about Spotify playlists.
- filetype:xlsx — narrows results to Excel workbook files.

For older Excel files, you can also try filetype:xls.

Step 3: Narrow the search

To search for publicly published files on a particular domain you own or have permission to assess, use this pattern:

site:your-authorized-domain.example playlist filetype:xlsx

Replace the example domain with your authorized test domain.

Step 4: Record the result

Record the search query, file title, public URL, and whether the workbook opens without authentication. I haven't verified a matching Spotify-related Excel file URL, so I won't invent one.

**4.Identify possible exposed admin panels for any Indian e-commerce site (like Flipkart or Myntra) using Google hacking. Write the dork you used and explain what makes such panels risky if left open.

Hint: Use 'intitle:admin site:flipkart.com' or similar.**

Ans-

Step 1: Use a controlled test domain

For your practical, use a domain you own or an intentionally vulnerable training lab rather than probing a real e-commerce company's internal administration pages.

Example query:

site:example.com intitle:admin

Copy querySearch Google

Step 2: Understand the query

- site:example.com — restricts results to the example domain.
- intitle:admin — searches for pages whose HTML title contains admin.

A result could be a public help page, a blog post, or a legitimate administration page. Search results alone cannot confirm exposure.

Step 3: Identify the security risks

Potential risks if an administration interface is improperly exposed include:

- Unauthorized access to customer or order information.
- Changes to product prices or product listings.
- Account takeover if authentication is weak.
- Website configuration changes or data deletion.
- Abuse of vulnerable administrative functions.

Step 4: Document your findings

Record the domain tested, exact query, result URL, page title, and whether access controls appear to be in place. Verify access controls only on systems you are authorized to test.
